1. Your motorcycle has broken down on a motorway. How will you know the direction of the nearest emergency telephone?

A. By walking with the flow of traffic

B. By remembering where the last phone was

C. By walking against the flow of traffic

D. By following an arrow on a marker post

2. When should you use the engine cut-out switch?

A. To stop the engine in an emergency

B. To stop the engine after a short journey

C. To save wear on the ignition switch

D. To start the engine if you lose the key

3. You're riding on a motorway. What does it mean if the car in front switches on its hazard warning lights?

A. The driver is trying to change lanes

B. The driver is going to take the next exit

C. There's danger ahead

D. There's a police car ahead

4. What should you do if your motorcycle breaks down while you're riding through a tunnel?

A. Switch on hazard warning lights

B. Remain on your motorcycle

C. Wait for the police to find you

D. Rely on CCTV cameras seeing you

5. What should you do if luggage falls from your motorcycle while you're riding on a motorway?

A. Pull up on the hard shoulder and wave traffic down

B. Stop at the next emergency telephone and report the hazard

C. Stop on the motorway and put on hazard warning lights while you pick it up

D. Walk back up the motorway to pick it up

6. What information should you find out if you're involved in a collision where someone is injured?

A. Whether the driver owns the other vehicle involved

B. Whether the other driver is licensed to drive

C. The occupation of the other driver

D. The other driver’s vehicle insurance details

7. When are you allowed to use hazard warning lights?

A. When stopped and temporarily obstructing traffic

B. When travelling during darkness without headlights

C. When parked on double yellow lines to visit a shop

D. When travelling slowly because you're lost

8. What should you do if you have to stop while you're going through a congested tunnel?

A. Pull up very close to the vehicle in front to save space

B. Ignore any message signs, as they're never up to date

C. Keep a safe distance from the vehicle in front

D. Make a U-turn and find another route

9. You arrive at the scene of a crash where someone is bleeding heavily from a wound in their arm. Nothing is embedded in the wound. What could you do to help?

A. Walk them around and keep them talking

B. Dab the wound

C. Get them a drink

D. Apply pressure over the wound

10. You're at an incident. What could you do to help an unconscious casualty?

A. Splash their face with cool water

B. Take photographs of the scene

C. Check that they're breathing normally

D. Move them to somewhere more comfortable

11. A casualty isn't breathing normally and needs CPR. At what rate should you press down and release on the centre of their chest?

A. 10 times per minute

B. 240 times per minute

C. 60 times per minute

D. 120 times per minute

12. Following a collision, a person has been injured. What would be a warning sign for shock?

A. Rapid shallow breathing

B. Slow pulse

C. Flushed complexion

D. Warm dry skin

13. An injured person has been placed in the recovery position. They're unconscious but breathing normally. What else should be done?

A. Place their arms by their side

B. Check their airway remains open

C. Give them a hot sweet drink

D. Press firmly between their shoulders

14. An injured motorcyclist is lying unconscious in the road. The traffic has stopped and there's no further danger. What could you do to help?

A. Remove their leather jacket

B. Move the person off the road

C. Seek medical assistance

D. Remove their safety helmet

15. What should you do if you see a large box fall from a lorry onto the motorway?

A. Pull over to the hard shoulder, then remove the box

B. Stop close to the box until the police arrive

C. Catch up with the lorry and try to get the driver's attention

D. Go to the next emergency telephone and report the hazard

16. You're going through a long tunnel. What will warn you of congestion or an incident ahead?

A. Hazard warning lines

B. Other drivers flashing their lights

C. Variable message signs

D. Areas with hatch markings

17. An adult casualty isn't breathing. To maintain circulation, CPR should be given. What's the correct depth to press down on their chest?

A. 15 to 20 centimetres

B. 10 to 15 centimetres

C. 5 to 6 centimetres

D. 1 to 2 centimetres

18. You're the first person to arrive at an incident where people are badly injured. You've switched on your hazard warning lights and checked all engines are stopped. What else should you do?

A. Stop other cars and ask the drivers for help

B. Move the people who are injured clear of their vehicles

C. Try and get people who are injured to drink something

D. Make sure that an ambulance has been called

19. You arrive at the scene of a motorcycle crash. The rider is injured. When should their helmet be removed?

A. Only when it's essential

B. Always straight away

C. Only when the motorcyclist asks

D. Always, unless they're in shock

20. You arrive at an incident. There's no danger from fire or further collisions and the emergency services have been called. What's your first priority when attending to an unconscious motorcyclist?

A. Check whether they have any bruising

B. Check whether they have any broken bones

C. Check whether they're bleeding

D. Check whether they're breathing normally

21. At an incident, someone is unconscious and you want to help. What would be the first thing to check?

A. Whether their vehicle is insured

B. Whether they have any allergies

C. Whether they're comfortable

D. Whether their airway is open

22. What could you do to help injured people at an incident?

A. Keep them warm and comfortable

B. Give them something to eat

C. Keep them on the move by walking them around

D. Give them a warm drink

23. There's been a collision. How can you help a driver who's suffering from shock?

A. Offer them a cigarette

B. Give them a drink

C. Reassure them confidently

D. Ask who caused the incident

24. You arrive at the scene of a motorcycle crash. No other vehicle is involved. The rider is unconscious and lying in the middle of the road. What's the first thing you should do at the scene?

A. Move the rider out of the road

B. Warn other traffic

C. Clear the road of debris

D. Give the rider reassurance

25. At an incident, how could you help a small child who isn't breathing?

A. Find their parents and explain what's happening

B. Open their airway and begin CPR

C. Put them in the recovery position and slap their back

D. Talk to them confidently until an ambulance arrives

26. At an incident, a casualty isn't breathing. What should you do while helping them to start breathing again?

A. Put their arms across their chest

B. Shake them firmly

C. Roll them onto their side

D. Open their airway

27. At an incident, someone is suffering from severe burns. How could you help them?

A. Apply lotions to the injury

B. Burst any blisters

C. Remove anything sticking to the burns

D. Douse the burns with clean, cool water

28. You arrive at an incident. A pedestrian is bleeding heavily from a leg wound. The leg isn't broken and there's nothing in the wound. How could you help?

A. Dab the wound to stop the bleeding

B. Keep the casualty's legs flat on the ground

C. Give them a warm drink

D. Apply firm pressure over the wound

29. At an incident, a casualty is unconscious but breathing. When should you move them?

A. When an ambulance is on its way

B. When bystanders tell you to move them

C. When there's a risk of further danger

D. When bystanders offer to help you

30. At an incident, it's important to look after any casualties. What should you do with them when the area is safe?

A. Keep them where they are

B. Give them something to eat

C. Ask them how it happened

D. Move them away from the vehicles

31. Which sign shows that a tanker is carrying dangerous goods?

A.

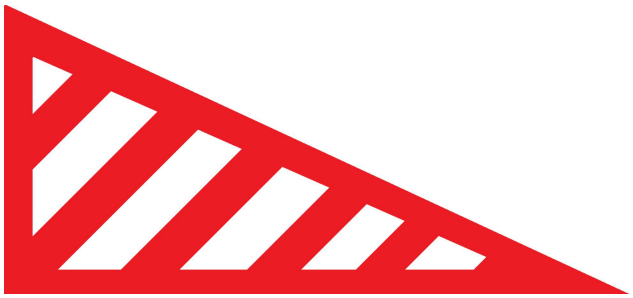

B.

C.

D.

32. Which document may the police ask you to produce after you've been involved in a collision?

A. Your vehicle service record

B. Your theory test certificate

C. Your driving licence

D. Your vehicle registration document

33. After a collision, someone is unconscious in their vehicle. When should you call the emergency services?

A. As soon as possible

B. Only as a last resort

C. After checking for broken bones

D. After you've woken them up

34. A collision has just happened. An injured person is lying in a busy road. What's the first thing you should do?

A. Make sure the injured person is kept warm

B. Treat the person for shock

C. Warn other traffic

D. Place them in the recovery position

35. At an incident, how could you help a casualty who has stopped breathing?

A. Try to give them something to drink

B. Raise their legs to help with circulation

C. Follow the DR ABC code

D. Keep their head tilted forwards as far as possible

36. You’re at the scene of an incident. How could you help someone who's suffering from shock?

A. Offer them some food

B. Give them a warm drink

C. Offer them a cigarette

D. Reassure them confidently

37. There's been a collision. A motorcyclist is lying injured and unconscious. Why should you only remove their helmet if it’s essential?

A. You could scratch the helmet as you remove it

B. Removing it could let them get cold

C. Removing it could make any injuries worse

D. They might not want you to remove it

38. You're on a motorway. When can you use hazard warning lights?

A. When you're using the hard shoulder as a running lane

B. When you're being towed by another vehicle

C. When you slow down quickly because of danger ahead

D. When a vehicle is following too closely

Answers

1. D - By following an arrow on a marker post

If you break down on a motorway, pull onto the hard shoulder and stop as far over to the left as you can. Switch on your hazard warning lights (if fitted) and go to the nearest emergency telephone. Marker posts spaced every 100 metres will show you where the nearest telephone is.

2. A - To stop the engine in an emergency

Most motorcycles are fitted with an engine cut-out switch. This is designed to stop the engine in an emergency and so reduce the risk of electrical sparks starting a fire.

3. C - There's danger ahead

Drivers and riders may switch on their hazard warning lights to warn following traffic of an obstruction or danger ahead. This only applies on motorways and dual carriageways that are subject to the national speed limit. The hazard warning lights should be turned off again when it's clear the warning has been seen.

4. A - Switch on hazard warning lights

If your motorcycle breaks down in a tunnel, it could present a danger to other traffic. First switch on your hazard warning lights and then call for help from an emergency telephone point. Don’t rely on being found by the police or being seen by a CCTV camera.

5. B - Stop at the next emergency telephone and report the hazard

If any of your luggage falls onto the road, pull onto the hard shoulder near an emergency telephone and call for assistance. Don’t stop on the carriageway or attempt to retrieve anything.

6. D - The other driver’s vehicle insurance details

If you're involved in a collision where someone is injured, your first priority is to warn other traffic and call the emergency services. Make sure you have all the information you need before you leave the scene - such as the other driver's name, phone number and insurance details. Don’t ride your motorcycle if it's unroadworthy.

7. A - When stopped and temporarily obstructing traffic

You mustn't use hazard warning lights while moving, except to warn traffic behind when you slow suddenly on a motorway or unrestricted dual carriageway. Never use hazard warning lights to excuse dangerous or illegal parking.

8. C - Keep a safe distance from the vehicle in front

It’s important to keep a safe distance from the vehicle in front at all times. This still applies in congested tunnels, even if you're moving very slowly or have stopped. If the vehicle in front breaks down, you may need room to manoeuvre past it.

9. D - Apply pressure over the wound

If possible, lay the casualty down. Protect yourself from exposure to blood and, when you're sure there's nothing in the wound, apply firm pressure using clean material.

10. C - Check that they're breathing normally

If a casualty is unconscious, you need to check that they're breathing normally. Look for chest movements, look and listen for breathing, and feel for breath on your cheek.

11. D - 120 times per minute

If a casualty isn't breathing normally, cardiopulmonary resuscitation (CPR) may be needed to maintain circulation. Place two hands on the centre of the chest and press down hard and fast – around 5–6 centimetres and about twice a second.

12. A - Rapid shallow breathing

The effects of shock may not be immediately obvious. Warning signs to look for include • a rapid pulse • sweating • pale grey skin • rapid shallow breathing.

13. B - Check their airway remains open

After a casualty has been placed in the recovery position, make sure their airway remains open and monitor their condition until medical help arrives. Where possible, don't move a casualty unless there’s further danger.

14. C - Seek medical assistance

If someone has been injured, the sooner proper medical attention is given the better. Ask someone to phone for help or do it yourself. An injured person should only be moved if they’re in further danger. An injured motorcyclist’s helmet shouldn't be removed unless it's essential.

15. D - Go to the next emergency telephone and report the hazard

Lorry drivers can be unaware of objects falling from their vehicles. If you see something fall onto a motorway, look to see if the driver pulls over. If they don't stop, don't attempt to retrieve the object yourself. Pull onto the hard shoulder near an emergency telephone and report the hazard.

16. C - Variable message signs

Follow the instructions given by the signs or by tunnel officials. In congested tunnels, a minor incident can soon turn into a major one, with serious or even fatal results.

17. C - 5 to 6 centimetres

An adult casualty isn't breathing normally. To maintain circulation, place two hands on the centre of the chest. Then press down hard and fast – around 5–6 centimetres and about twice a second.

18. D - Make sure that an ambulance has been called

If you’re the first to arrive at a crash scene, the first concerns are the risk of further collision and fire. Ensuring that vehicle engines are switched off will reduce the risk of fire. Use hazard warning lights so that other traffic knows there’s a need for caution. Make sure the emergency services are contacted; don’t assume it's already been done.

19. A - Only when it's essential

Don't remove a motorcyclist's helmet unless it's essential. Remember they may be suffering from shock. Don't give them anything to eat or drink, but do reassure them confidently.

20. D - Check whether they're breathing normally

At the scene of an incident, always be aware of danger from further collisions or fire. The first priority when dealing with an unconscious person is to ensure they can breathe. This may involve clearing their airway if you can see an obstruction or if they’re having difficulty breathing.

21. D - Whether their airway is open

Remember this procedure by saying DR ABC. This stands for Danger, Response, Airway, Breathing, Circulation. Give whatever first aid you can and stay with the injured person until a medical professional takes over.

22. A - Keep them warm and comfortable

There are a number of things you can do to help, even without expert training. Be aware of further danger from other traffic and fire; make sure the area is safe. People may be in shock. Don’t give them anything to eat or drink. Keep them warm and comfortable and reassure them. Don’t move injured people unless there’s a risk of further danger.

23. C - Reassure them confidently

A casualty suffering from shock may have injuries that aren't immediately obvious. Call the emergency services, then stay with the person in shock, offering reassurance until the experts arrive.

24. B - Warn other traffic

The motorcyclist is in an extremely vulnerable position, exposed to further danger from traffic. Approaching vehicles need advance warning in order to slow down and safely take avoiding action or stop. Don't put yourself or anyone else at risk. Use the hazard warning lights on your vehicle to alert other road users to the danger.

25. B - Open their airway and begin CPR

If a young child has stopped breathing, first check that their airway is open and then begin CPR. With a young child, you may only need to use one hand and you shouldn’t press down as far as you would with an adult. Continue the procedure until the child is breathing again or until a medical professional takes over.

26. D - Open their airway

It’s important to ensure that the airway is open before you start CPR. To open the casualty’s airway, place your fingers under their chin and lift it forward.

27. D - Douse the burns with clean, cool water

Your priority is to cool the burns with clean, cool water. Its coolness will help take the heat out of the burns and relieve the pain. Keep the wound doused for at least 20 minutes. If blisters appear, don’t attempt to burst them, as this could lead to infection.

28. D - Apply firm pressure over the wound

You should protect yourself from exposure to blood, and then apply firm pressure over the wound to stem the flow of blood. As soon as practical, fasten a pad to the wound with a bandage or length of cloth. Use the cleanest material available.

29. C - When there's a risk of further danger

Don't move a casualty unless there's further danger; for example, from other traffic or fire. They may have unseen or internal injuries. Moving them unnecessarily could cause further injury. Don't remove a motorcyclist’s helmet unless it’s essential.

30. A - Keep them where they are

When the area is safe and there's no danger from other traffic or fire, it's better not to move casualties. Moving them may cause further injury.

31. C -

Tankers will display a hazard warning plate on the side and rear of the vehicle. Details of hazard warning symbols are given in The Highway Code. If a tanker is involved in a collision, you may need to report the tanker's hazard labelling to the emergency services.

32. C - Your driving licence

You must stop if you've been involved in a collision that results in injury or damage. The police may ask to see your driving licence and insurance details at the time or later at a police station.

33. A - As soon as possible

It's important to make sure that the emergency services arrive as soon as possible. When a person is unconscious, they could have serious injuries that aren't immediately obvious.

34. C - Warn other traffic

The most immediate danger is further collisions and fire. You could warn other traffic by switching on hazard warning lights, displaying an advance warning triangle or sign (but not on a motorway), or by any other means that doesn’t put you or others at risk.

35. C - Follow the DR ABC code

The DR ABC code has been devised by medical experts to give the best outcome until the emergency services arrive and take care of casualties.

36. D - Reassure them confidently

If someone is suffering from shock, try to keep them warm and as comfortable as you can. Don’t give them anything to eat or drink but reassure them confidently and try not to leave them alone.

37. C - Removing it could make any injuries worse

When someone is injured, any movement that isn't absolutely necessary should be avoided, since it could make the injuries worse. Unless it's essential to remove a motorcyclist's helmet, it’s generally safer to leave it in place.

38. C - When you slow down quickly because of danger ahead

Briefly using your hazard warning lights will warn the traffic behind you that there's a hazard ahead. Turn them off again when following drivers have seen and responded to your signal.
