1. How much can stopping distances increase in icy conditions?

A. Two times

B. Ten times

C. Five times

D. Three times

2. What requires extra care when you're driving or riding in windy conditions?

A. Using the brakes

B. Passing pedal cyclists

C. Turning into a narrow road

D. Moving off on a hill

3. Why should you keep well to the left as you approach a right-hand bend?

A. To improve your view of the road

B. To be positioned safely if you skid

C. To let faster traffic from behind overtake

D. To overcome the effect of the road's slope

4. You've just gone through flood water. What should you do to make sure your brakes are working properly?

A. Go slowly while gently applying the brakes

B. Stop for at least an hour to allow them time to dry

C. Avoid using the brakes at all for a few miles

D. Accelerate and keep to a high speed for a short time

5. What will be affected if the road surface becomes soft in very hot weather?

A. The suspension

B. The exhaust emissions

C. The fuel consumption

D. The tyre grip

6. Where is your vehicle most likely to be affected by side winds?

A. On a long, straight road

B. On a busy stretch of road

C. On an open stretch of road

D. On a narrow country lane

7. You're following a vehicle on a wet road. You stay a safe distance behind it. What should you do if a driver overtakes you and pulls into the gap you've left?

A. Stay close to the other vehicle until it moves on

B. Drop back to regain a safe distance

C. Try to overtake safely as soon as you can

D. Flash your headlights as a warning

8. You're travelling on the motorway. How can you lower the risk of a collision when the vehicle behind is following too closely?

A. Move onto the hard shoulder and stop

B. Increase your distance from the vehicle in front

C. Brake sharply

D. Switch on your hazard warning lights

9. You're following other vehicles in fog. You have your headlights on dipped beam. What else can you do to reduce the chances of being in a collision?

A. Keep close to the vehicle in front

B. Use main beam instead of dipped headlights

C. Keep up with the faster vehicles

D. Keep a safe distance from the vehicle in front

10. What should you do when you're using a contraflow system?

A. Follow other motorists closely to avoid long queues

B. Choose an appropriate lane in good time

C. Switch lanes to make better progress

D. Increase speed to get through the contraflow more quickly

11. How can you avoid wheelspin when you're driving on an icy road?

A. Drive at a slow speed in the highest gear possible

B. Use the parking brake if the wheels start to slip

C. Brake gently and repeatedly

D. Drive in a low gear at all times

12. What's the main cause of skidding?

A. The weather

B. The driver

C. The vehicle

D. The road

13. You're driving in freezing conditions. What should you do as you approach a sharp bend?

A. Coast into the bend

B. Apply your parking brake

C. Firmly use your footbrake

D. Slow down gently

14. You're about to start a journey in freezing weather. What part of your vehicle should you clear of ice and snow?

A. The aerial

B. The windows

C. The bumper

D. The boot

15. What will help you to move off on a snowy surface?

A. Using the parking brake and footbrake together

B. Using a high engine speed

C. Using a higher gear than normal

D. Using the car's lowest gear

16. What should you do when you're driving in snowy conditions?

A. Be ready to steer sharply

B. Brake gently in plenty of time

C. Use sidelights only

D. Brake firmly and quickly

17. What's the main benefit of driving a four-wheel-drive vehicle?

A. Improved passenger comfort

B. Shorter stopping distances

C. Improved grip on the road

D. Lower fuel consumption

18. You're about to go down a steep hill. What should you do to control the speed of your vehicle?

A. Select a high gear and use the brakes firmly

B. Select a high gear and use the brakes carefully

C. Select a low gear and use the brakes carefully

D. Select a low gear and avoid using the brakes

19. What should you do when you park a car facing downhill?

A. Turn the steering wheel towards the kerb

B. Turn the steering wheel away from the kerb

C. Park with two wheels on the kerb

D. Park close to the bumper of another car

20. You're driving in a built-up area that has traffic-calming measures. What should you do when you approach a road hump?

A. Move across to the left-hand side of the road

B. Stop and check both pavements

C. Check your mirror and slow down

D. Wait for any pedestrians to cross

21. On what type of road surface may anti-lock brakes be ineffective?

A. Dry

B. Smooth

C. Firm

D. Loose

22. You're driving a vehicle that has anti-lock brakes. How should you apply the footbrake when you need to stop in an emergency?

A. Slowly and gently

B. Rapidly and firmly

C. Rapidly and gently

D. Slowly but firmly

23. You're driving along a country road. You see this sign. What should you do after dealing safely with the hazard?

A. Check your tyre pressures

B. Switch on your hazard warning lights

C. Accelerate briskly

D. Test your brakes

24. What would suggest you're driving on an icy road?

A. There's less wind noise

B. There's less tyre noise

C. There's less transmission noise

D. There's less engine noise

25. You're driving along a wet road. How can you tell if your vehicle's tyres are losing their grip on the surface?

A. The steering will feel very light

B. The engine will stall

C. The steering will feel very heavy

D. The engine noise will increase

26. In which conditions will your overall stopping distance increase?

A. In strong winds

B. At night

C. In fog

D. In the rain

27. You're driving on an open road in dry weather. What distance should you keep from the vehicle in front?

A. A two-second time gap

B. One car length

C. Two metres (6 feet 6 inches)

D. Two car lengths

28. How can you use your vehicle's engine as a brake?

A. By selecting neutral gear

B. By changing to a higher gear

C. By selecting reverse gear

D. By changing to a lower gear

29. How should you use anti-lock brakes when you need to stop in an emergency?

A. Apply the parking brake to reduce the stopping distance

B. Keep pumping the footbrake to prevent skidding

C. Brake normally but grip the steering wheel tightly

D. Brake promptly and firmly until you've stopped

30. What lights should you use when you're driving on a wet motorway and vehicles are throwing up surface spray?

A. Dipped headlights

B. Hazard warning lights

C. Sidelights

D. Rear fog lights

31. What can result when you travel for long distances in neutral (known as coasting)?

A. Reduction in control

B. Improvement in control

C. Increased fuel consumption

D. Easier steering

32. What should you do before starting a journey in foggy weather?

A. Reduce your tyre pressures

B. Wear a hi-visibility jacket

C. Have a caffeinated drink

D. Allow more time

33. What should you do when you're overtaking a motorcyclist on a windy day?

A. Pass closely

B. Pass immediately

C. Pass widely

D. Pass very slowly

34. What does it mean if the Electronic Stability Control (ESC) indicator light comes on briefly while you're driving?

A. The ESC system has a fault

B. The ESC system has activated

C. The ESC system is switched off

D. The ESC system is running a routine test

Answers

1. B - Ten times

Tyre grip is greatly reduced in icy conditions. For this reason, you need to allow up to ten times the stopping distance you would allow on dry roads.

2. B - Passing pedal cyclists

Always give cyclists plenty of room when overtaking them. You need to give them even more room when it’s windy. A sudden gust could easily blow them off course and into your path.

3. A - To improve your view of the road

Keeping to the left as you approach right-hand bends will give you an earlier view around the bend and enable you to see any hazards sooner. It also reduces the risk of collision with any oncoming vehicle that may have drifted over the centre line while taking the bend.

4. A - Go slowly while gently applying the brakes

Water on the brakes will act as a lubricant, causing them to work less efficiently. Using the brakes lightly as you go along will quickly dry them out.

5. D - The tyre grip

If the road surface becomes very hot, it can soften. Tyres are unable to grip a soft surface as well as they can a firm dry one. Take care when cornering and braking.

6. C - On an open stretch of road

In windy conditions, care must be taken on exposed roads. A strong gust of wind can blow you off course. Watch out for other road users who are particularly likely to be affected, such as cyclists, motorcyclists, high-sided lorries and vehicles towing trailers.

7. B - Drop back to regain a safe distance

Wet weather will affect the time it takes for you to stop and can affect your control. Your speed should allow you to stop safely and in good time. If another vehicle pulls into the gap you've allowed, ease back until you've regained your stopping distance.

8. B - Increase your distance from the vehicle in front

On busy roads, traffic may still travel at high speeds. Don't follow the vehicle in front too closely. If a driver behind seems to be 'pushing' you, gradually increase your distance from the vehicle in front by slowing down gently. This will give you more space in front if you have to brake, and will reduce the risk of a collision involving several vehicles.

9. D - Keep a safe distance from the vehicle in front

When it's foggy, use your headlights on dipped beam. This will help you see and be seen by other road users. If visibility is seriously reduced, consider using front and rear fog lights if you have them. Keep to a sensible speed and don't follow the vehicle in front too closely. If the road is wet and slippery, you'll need to allow twice the normal stopping distance.

10. B - Choose an appropriate lane in good time

In a contraflow system, you'll be travelling close to oncoming traffic and sometimes in narrow lanes. You should get into the correct lane in good time, obey any temporary speed-limit signs and keep a safe separation distance from the vehicle ahead.

11. A - Drive at a slow speed in the highest gear possible

If you’re travelling on an icy road, extra caution will be required to avoid loss of control. Keeping your speed down and using the highest gear possible will reduce the risk of the tyres losing their grip on this slippery surface.

12. B - The driver

Skidding is usually caused by driver error. You should always adjust your driving to take account of the road and weather conditions.

13. D - Slow down gently

Harsh use of the accelerator, brakes or steering is likely to lead to skidding, especially on slippery surfaces. Avoid steering and braking at the same time. In icy conditions, it’s very important that you constantly assess what’s ahead so that you can take appropriate action in plenty of time.

14. B - The windows

Driving in bad weather increases your risk of having a collision. If you absolutely have to travel, clear your lights, mirrors, number plates and windows of any snow or ice, so that you can see and be seen.

15. C - Using a higher gear than normal

If you attempt to move off in a low gear, there'll be more torque (turning force) at the driven wheels than if you use a higher gear. More torque makes it easier for the tyres to lose grip and so spin the wheels.

16. B - Brake gently in plenty of time

In snowy conditions, be careful with the steering, accelerator and brakes. Braking sharply while you're driving on snow is likely to make your car skid.

17. C - Improved grip on the road

By driving all four wheels, the vehicle has maximum grip on the road. This grip is especially helpful when travelling on slippery or uneven surfaces. However, having four-wheel drive doesn't replace the skills you need to drive safely.

18. C - Select a low gear and use the brakes carefully

When driving down a steep hill, gravity will cause your vehicle to speed up. This will make it more difficult for you to stop. To help keep your vehicle's speed under control, select a lower gear to give you more engine braking and make careful use of the brakes.

19. A - Turn the steering wheel towards the kerb

Turning the wheels towards the kerb will allow them to act as a chock, preventing any forward movement of the vehicle. It will also help to leave your car in gear, or select ‘Park’ if you have an automatic.

20. C - Check your mirror and slow down

Many towns have road humps as part of traffic-calming measures, designed to slow down traffic. Reduce your speed when driving over them. If you go too fast, you could lose control or damage your car. Look out for pedestrians or cyclists while you're driving in these areas.

21. D - Loose

Poor contact with the road surface could cause one or more of the tyres to lose grip on the road. This is more likely to happen when braking in poor weather conditions and when the road has a loose, slippery or uneven surface.

22. B - Rapidly and firmly

You may have to stop in an emergency due to a misjudgement by another driver or a hazard arising suddenly, such as a child running out into the road. If your vehicle has anti-lock brakes, you should apply the brakes immediately and keep them firmly applied until you stop.

23. D - Test your brakes

If your brakes have been thoroughly soaked, you should check that they're working properly before you build up speed again. Before you do this, remember to check your mirrors and consider what's behind you.

24. B - There's less tyre noise

Drive extremely carefully when the roads are icy. When travelling on ice, tyres make virtually no noise and the steering feels light and unresponsive. In icy conditions, be very gentle when braking, accelerating and steering.

25. A - The steering will feel very light

If you drive at speed in very wet conditions, your steering may suddenly feel lighter than usual. This means that the tyres have lifted off the surface of the road and are floating on the surface of the water. This is known as aquaplaning. Reduce speed but don’t brake until your steering returns to normal.

26. D - In the rain

Extra care should be taken in wet weather. On wet roads, your stopping distance could be double that in dry conditions.

27. A - A two-second time gap

One way of checking there's a safe distance between you and the vehicle in front is to use the two-second rule. To check for a two-second time gap, choose a stationary object ahead, such as a bridge or road sign. When the car in front passes the object, say 'Only a fool breaks the two-second rule'. If you reach the object before you finish saying the phrase, you're too close and need to increase the gap.

28. D - By changing to a lower gear

When driving on downhill stretches of road, selecting a lower gear gives increased engine braking. This will prevent excessive use of the brakes, which become less effective if they overheat.

29. D - Brake promptly and firmly until you've stopped

If you have ABS and need to stop in an emergency, keep your foot firmly on the brake pedal until the vehicle has stopped. When the ABS operates, you may hear a grating sound and feel vibration through the brake pedal. This is normal and you should maintain pressure on the brake pedal until the vehicle stops.

30. A - Dipped headlights

When surface spray reduces visibility, switch on your headlights on dipped beam. This will help other road users to see you.

31. A - Reduction in control

Coasting is the term used when the clutch is held down, or the gear lever is in neutral, and the vehicle is allowed to freewheel. This reduces the driver's control of the vehicle. When you coast, the engine can't drive the wheels to stabilise you through a corner, or give the assistance of engine braking to help slow the car.

32. D - Allow more time

Don’t venture out if your journey isn’t necessary. If you have to travel and someone is expecting you at the other end, let them know that you’ll be taking longer than usual for your journey. This will stop them worrying if you don’t turn up on time and will also take the pressure off you, so you don’t feel you have to rush.

33. C - Pass widely

In strong winds, riders of two-wheeled vehicles are particularly vulnerable. When you overtake them, allow plenty of room. Check to the left as you pass to make sure they're safe.

34. B - The ESC system has activated

ESC is a computer controlled technology that detects reduced traction and automatically makes corrective adjustments to prevent loss of control. The ESC light comes on briefly to alert the driver that the system has activated and the car is approaching its handling limits. It’s a powerful driver aid but it cannot save a car once its traction limits have been exceeded.
