1. When may you overtake another vehicle on their left?

A. When you’re in a one-way street

B. When a slower vehicle is travelling in the right-hand lane of a dual carriageway

C. When the vehicle in front is signalling to turn left

D. When approaching a motorway slip road where you’ll be turning off

2. You're travelling in very heavy rain. How is this likely to affect your overall stopping distance?

A. It will be no different

B. It will be doubled

C. It will be halved

D. It will be ten times greater

3. What should you do when you're overtaking at night?

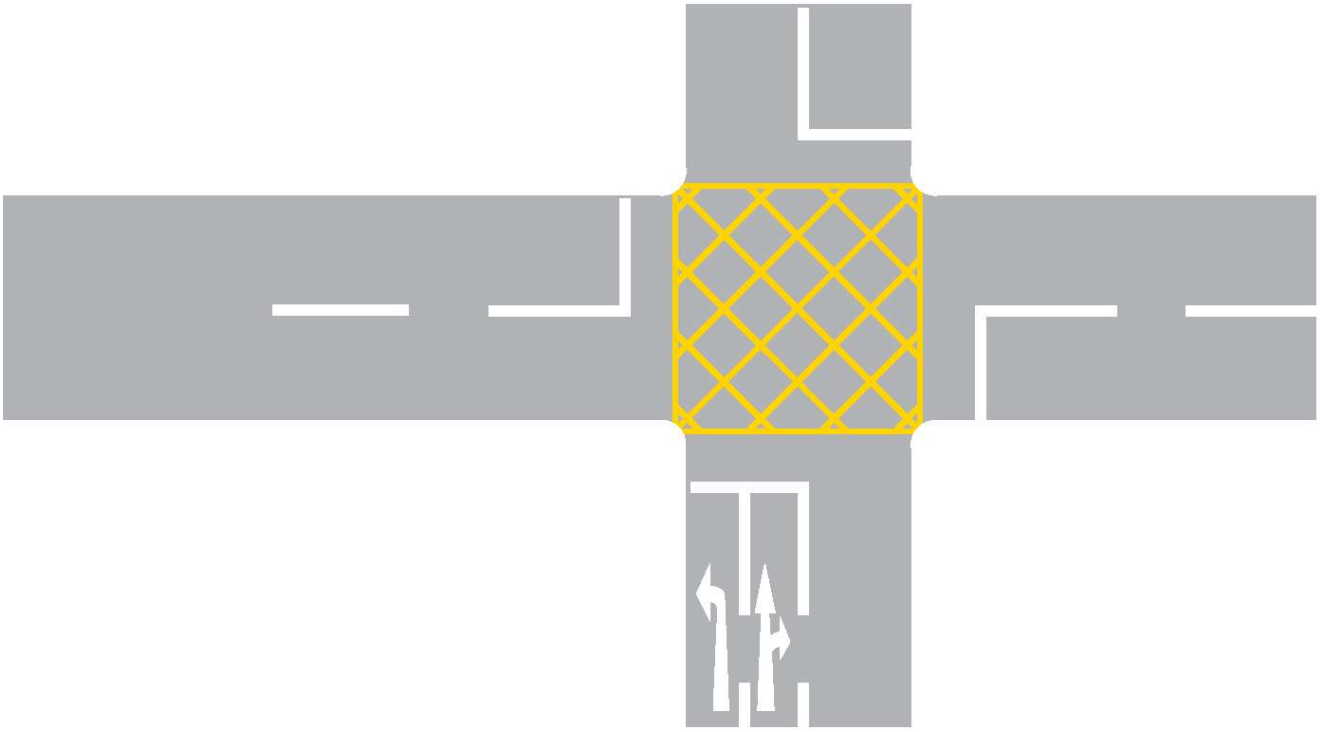

A. Wait until a bend so that you can see oncoming headlights

B. Sound your horn twice before moving out

C. Go past slowly so that you can react to unseen hazards

D. Beware of bends in the road ahead

4. When may you wait in a box junction?

A. When oncoming traffic prevents you turning right

B. When you're stationary in a queue of traffic

C. When approaching a pelican crossing

D. When approaching a zebra crossing

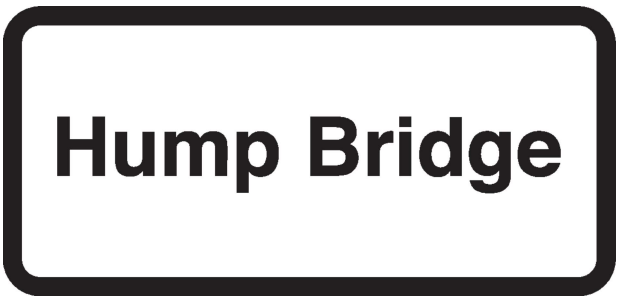

5. Which plate may appear with this road sign?

A.

B.

C.

D.

6. What's the reason for traffic-calming measures?

A. To make parking easier

B. To stop road rage

C. To make overtaking easier

D. To slow traffic down

7. What colour are the reflective studs along the left-hand edge of the motorway?

A. Green

B. Amber

C. Red

D. White

8. What's a rumble device designed to do?

A. Alert you to a hazard

B. Give directions

C. Prevent cattle escaping

D. Alert you to low tyre pressure

9. What should you do if you have to make a journey in foggy conditions?

A. Follow other vehicles' tail lights closely

B. Avoid using dipped headlights

C. Leave plenty of time for your journey

D. Keep two seconds behind the vehicle ahead

10. What must you do when you're overtaking a car at night?

A. Switch your headlights to main beam before overtaking

B. Flash your headlights before overtaking

C. Select a higher gear

D. Make sure you don't dazzle other road users

11. You're travelling on a road that has road humps. What should you do when the driver in front is travelling more slowly than you?

A. Slow down and stay behind

B. Sound your horn

C. Overtake as soon as you can

D. Flash your headlights

12. What's the purpose of the yellow lines painted across the road?

A. To show a safe distance between vehicles

B. To warn you to change direction

C. To make you aware of your speed

D. To keep the area clear of traffic

13. What should you do when you meet an oncoming vehicle on a single-track road?

A. Switch on your hazard warning lights

B. Reverse back to the main road

C. Carry out an emergency stop

D. Stop at a passing place

14. The road is wet. Why would a motorcyclist steer around drain covers while they were cornering?

A. To avoid puncturing the tyres on the edge of the drain covers

B. To prevent the motorcycle sliding on the metal drain covers

C. To help judge the bend using the drain covers as marker points

D. To avoid splashing pedestrians on the pavement

15. Why should you test your brakes after this hazard?

A. You'll be going down a long hill

B. You'll be on a slippery road

C. Your brakes will be wet

D. You'll have just crossed a long bridge

16. Why should you reduce your speed when you're driving or riding in fog?

A. It's more difficult to see what's ahead

B. The brakes don't work as well

C. You'll be dazzled by other headlights

D. The engine will take longer to warm up

17. What will happen to your car when you drive up a steep hill?

A. The high gears will pull better

B. The engine will work harder

C. Overtaking will be easier

D. The steering will feel heavier

18. You're driving on the motorway in windy conditions. What should you do as you overtake a high-sided vehicle?

A. Expect normal conditions

B. Increase your speed

C. Be wary of a sudden gust

D. Drive alongside very closely

19. You're driving in fog. Why should you keep well back from the vehicle in front?

A. In case it changes direction suddenly

B. In case it stops suddenly

C. In case its brake lights dazzle you

D. In case its fog lights dazzle you

20. What should you do if you park on the road when it's foggy?

A. Leave dipped headlights switched on

B. Leave dipped headlights and fog lights switched on

C. Leave parking lights switched on

D. Leave main-beam headlights switched on

21. You're driving at night. What should you do if you're dazzled by headlights coming towards you?

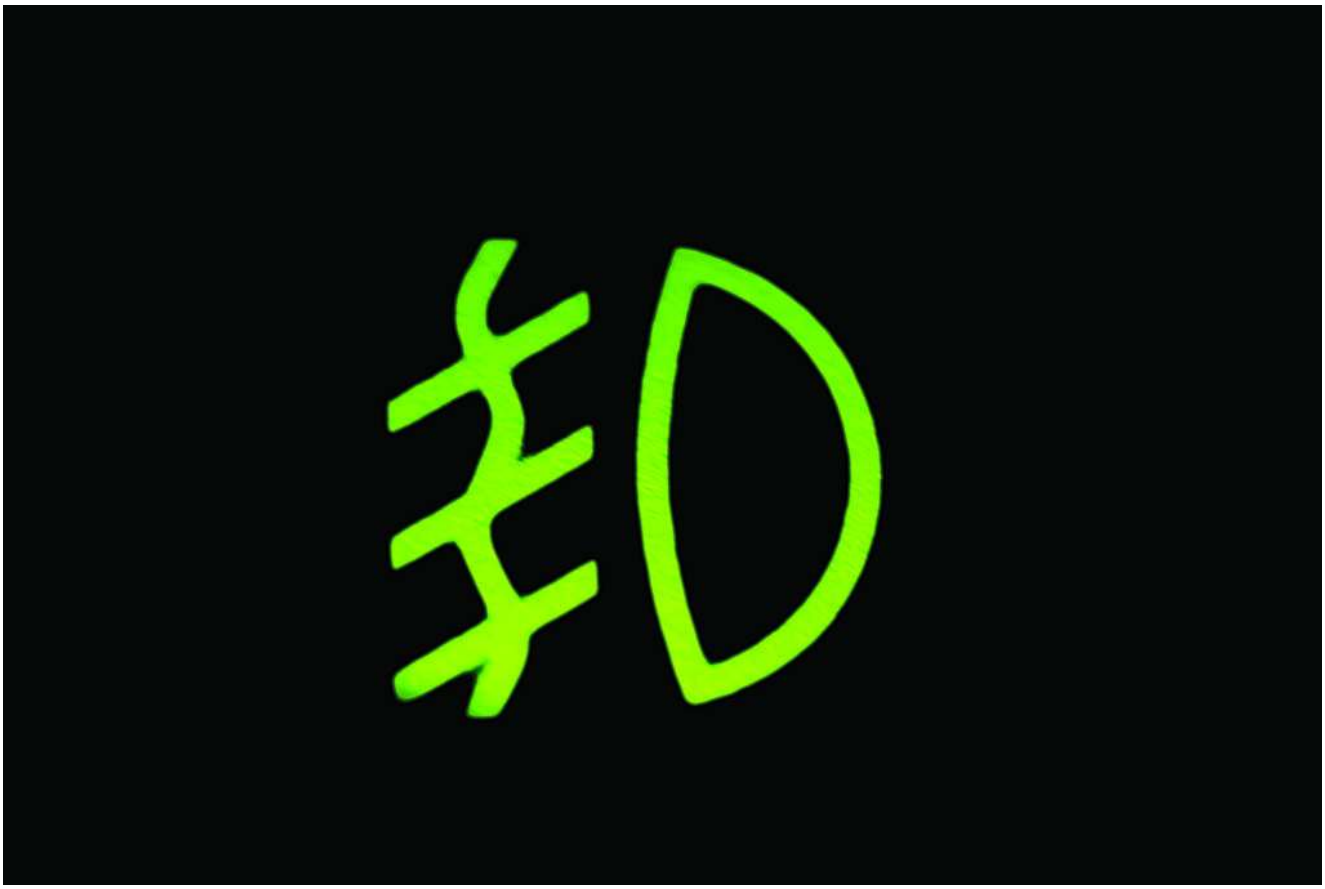

A. Pull down your sun visor

B. Slow down or stop

C. Shade your eyes with your hand

D. Flash your main-beam headlights

22. When may front fog lights be used?

A. When they aren't as bright as the headlights

B. When visibility is seriously reduced

C. When they're fitted above the bumper

D. When an audible warning device is used

23. You're driving with your front fog lights switched on. What should you do if the fog has cleared?

A. Drive with them on instead of your headlights

B. Leave them on if other drivers have their lights on

C. Switch them off as long as visibility remains good

D. Flash them to warn oncoming traffic that it's foggy

24. Why should you switch off your rear fog lights when the fog has cleared?

A. To allow your headlights to work

B. To prevent dazzling drivers behind

C. To stop the engine losing power

D. To stop draining the battery

25. What will happen if you use rear fog lights in good conditions?

A. They'll make drivers behind keep back

B. They'll make it safer when towing a trailer

C. They'll protect you from larger vehicles

D. They'll dazzle other drivers

26. Why would you fit chains to your wheels?

A. To help prevent damage to the road surface

B. To help prevent wear to the tyres

C. To help prevent skidding in deep snow

D. To help prevent the brakes locking

27. How can you use your vehicle's engine to control your speed?

A. By changing to a higher gear

B. By changing to a lower gear

C. By selecting reverse gear

D. By selecting neutral

28. Why could it be dangerous to keep the clutch down, or select neutral, for long periods of time while you're driving?

A. It will wear tyres out more quickly

B. Fuel spillage will occur

C. Engine damage may be caused

D. You'll have less steering and braking control

29. You're driving on an icy road. What distance from the car in front should you drive?

A. Four times the normal distance

B. Ten times the normal distance

C. Eight times the normal distance

D. Six times the normal distance

30. Which lights must you use if you're driving on a well-lit motorway at night?

A. Use front fog lights

B. Use only your sidelights

C. Use your headlights

D. Use rear fog lights

31. You're driving on a motorway at night. Which lights should you have on if there are other vehicles just ahead of you?

A. Front fog lights

B. Dipped headlights

C. Sidelights only

D. Main-beam headlights

32. What will affect your vehicle's stopping distance?

A. The street lighting

B. The time of day

C. The condition of the tyres

D. The speed limit

33. When will you feel the effects of engine braking?

A. When you only use the parking brake

B. When you change to a lower gear

C. When you change to a higher gear

D. When you're in neutral

34. Which lights should you switch on when daytime visibility is poor but not seriously reduced?

A. Dipped headlights

B. Headlights and fog lights

C. Front fog lights

D. Rear fog lights

35. Why are vehicles fitted with rear fog lights?

A. To make them more visible when driving at high speed

B. To show when they've broken down in a dangerous position

C. To make them more visible in thick fog

D. To warn drivers following closely to drop back

36. There's been a heavy fall of snow. What should you consider before driving in these conditions?

A. Whether you should fit an amber flashing beacon to your car

B. Whether you should drive without wearing your seat belt

C. Whether you should wear sunglasses to reduce the glare

D. Whether your journey is essential

37. What should you check before you start a journey in foggy weather?

A. The radiator has enough anti-freeze

B. You have a warning triangle in the vehicle

C. The windows and lights are clean and clear

D. You have a mobile phone with you

38. You've been driving in fog. What must you do when the visibility improves?

A. Switch off your fog lights

B. Keep your rear fog lights switched on

C. Keep your front fog lights switched on

D. Leave your fog lights switched on in case the fog returns

39. Why is it dangerous to leave rear fog lights switched on after the fog has cleared?

A. They may be confused with brake lights

B. The bulbs would fail

C. Electrical systems could be overloaded

D. Direction indicators may not work properly

40. What will happen if you hold the clutch pedal down or roll in neutral for too long?

A. It will use more fuel

B. It will cause the engine to overheat

C. It will reduce your control

D. It will improve tyre wear

41. Why is it bad technique to coast when you're driving downhill?

A. The fuel consumption will increase

B. The engine will overheat

C. The tyres will wear more quickly

D. The vehicle will gain speed more quickly

42. What should you do when dealing with this hazard?

A. Switch on your hazard warning lights

B. Use a low gear and drive slowly

C. Use a high gear to prevent wheelspin

D. Switch on your windscreen wipers

43. Why is travelling in neutral for long distances (known as coasting) bad driving technique?

A. There won't be any engine braking

B. It will cause the car to skid

C. It will make the engine stall

D. The engine will run faster

44. When must you use dipped headlights during the day?

A. All the time you're driving

B. When you're driving along narrow streets

C. When you're driving in poor visibility

D. When you're parking

45. What should you do when you're driving along a road that has a series of road humps?

A. Brake firmly when you reach each road hump

B. Vary your speed between each road hump

C. Set your car's cruise control

D. Stay at a reduced speed for the whole stretch of road

Answers

1. A - When you’re in a one-way street

You may pass slower vehicles on their left while travelling along a one-way street. Be aware of drivers who may need to change lanes and may not expect faster traffic passing on their left.

2. B - It will be doubled

The road will be very wet and spray from other vehicles will reduce your visibility. Tyre grip will also be reduced, increasing your stopping distance. You should at least double your separation distance to make sure you can stop safely in the space you've allowed.

3. D - Beware of bends in the road ahead

Don't overtake if there’s a possibility of a road junction, bend or brow of a bridge or hill ahead. There are many hazards that are difficult to see in the dark. Only overtake if you’re certain that the road ahead is clear. Don’t take a chance.

4. A - When oncoming traffic prevents you turning right

The purpose of a box junction is to keep the junction clear by preventing vehicles from stopping in the path of crossing traffic. You mustn't enter a box junction unless your exit is clear. However, you may enter the box and wait if you want to turn right and are only prevented from doing so by oncoming traffic.

5. A -

Road humps are used to slow down traffic. They're found in places where there are often pedestrians, such as • shopping areas • near schools • residential areas. Watch out for people close to the kerb or crossing the road.

6. D - To slow traffic down

Traffic-calming measures make the roads safer for vulnerable road users, such as cyclists, pedestrians and children. These can be designed as chicanes, road humps or other obstacles that encourage drivers and riders to slow down.

7. C - Red

Reflective studs are used to help you in poor visibility. Different colours are used so that you'll know which lane you're in. These are • red on the left-hand edge of the carriageway • white between lanes • amber on the right-hand edge of the carriageway • green between the carriageway and slip roads.

8. A - Alert you to a hazard

A rumble device consists of raised markings or strips, designed to give drivers an audible, visual and tactile warning. These devices are used in various locations, including in the line separating the hard shoulder and the left-hand lane on the motorway and on the approach to some hazards, to alert drivers to the need to slow down.

9. C - Leave plenty of time for your journey

If you're planning to make a journey when it's foggy, listen to the weather reports. If visibility is very poor, avoid making unnecessary journeys. If you do travel, leave plenty of time – and if someone is waiting for you to arrive, let them know that your journey will take longer than normal. This will also take off any pressure you may feel to rush.

10. D - Make sure you don't dazzle other road users

To prevent your headlights from dazzling the driver of the car in front, wait until you've passed them before switching to main beam.

11. A - Slow down and stay behind

Be patient and stay behind the car in front. You shouldn't normally overtake other vehicles in areas subject to traffic calming. If you overtake here, you may easily exceed the speed limit, defeating the purpose of the traffic-calming measures.

12. C - To make you aware of your speed

These lines may be painted on the road on the approach to a roundabout, a village or a particular hazard. The lines are raised and painted yellow, and their purpose is to make you aware of your speed. Reduce your speed in good time so that you avoid having to brake harshly over the last few metres before reaching the junction.

13. D - Stop at a passing place

Take care when using single-track roads. It can be difficult to see around bends, because of hedges or fences, so expect to meet oncoming vehicles. Drive carefully and be ready to pull into or stop opposite a passing place, where you can pass each other safely.

14. B - To prevent the motorcycle sliding on the metal drain covers

Other drivers or riders may have to change course due to the size or characteristics of their vehicle. Understanding this will help you to anticipate their actions. Motorcyclists and cyclists will be checking the road ahead for uneven or slippery surfaces, especially in wet weather. They may need to move across their lane to avoid surface hazards such as potholes and drain covers.

15. C - Your brakes will be wet

A ford is a crossing over a stream that’s shallow enough to drive or ride through. After you’ve gone through a ford or deep puddle, your brakes will be wet and they won't work as well as usual. To dry them out, apply a light brake pressure while moving slowly. Don’t travel at normal speeds until you're sure your brakes are working properly again.

16. A - It's more difficult to see what's ahead

You won’t be able to see as far ahead in fog as you can on a clear day. You'll need to reduce your speed so that, if a hazard looms out of the fog, you have the time and space to take avoiding action. Travelling in fog is hazardous. If you can, try to delay your journey until it has cleared.

17. B - The engine will work harder

The engine will need more power to pull the vehicle up the hill. When approaching a steep hill you should select a lower gear to help maintain your speed. You should do this without hesitation, so that you don’t lose too much speed before engaging the lower gear.

18. C - Be wary of a sudden gust

The draught caused by other vehicles – particularly those with high sides – could be strong enough to push you out of your lane. Be prepared for a sudden gust of wind as you overtake large vehicles. Keep both hands on the steering wheel to help you keep full control.

19. B - In case it stops suddenly

If you’re following another road user in fog, stay well back. The driver in front won’t be able to see hazards until they’re close and might need to brake suddenly. Also, the road surface is likely to be wet and could be slippery.

20. C - Leave parking lights switched on

If you have to park your vehicle in foggy conditions, try to find a place to park off the road. If this isn’t possible, park on the road facing in the same direction as the traffic. Leave your parking lights switched on and make sure they're clean.

21. B - Slow down or stop

If the headlights of an oncoming vehicle dazzle you, slow down or, if necessary, stop. Don’t close your eyes or swerve, as you'll increase your chances of having a collision. Don't flash your headlights either, as this could dazzle other drivers and make the situation worse.

22. B - When visibility is seriously reduced

Your fog lights must only be used when visibility is reduced to 100 metres (328 feet) or less. You need to be familiar with the layout of your dashboard so you're aware if your fog lights have been switched on in error, or you've forgotten to switch them off.

23. C - Switch them off as long as visibility remains good

Switch off your fog lights if the weather improves, but be prepared to use them again if visibility reduces to less than 100 metres (328 feet).

24. B - To prevent dazzling drivers behind

Don’t forget to switch off your fog lights when the weather improves. You could be prosecuted for driving with them on in good visibility. The high intensity of rear fog lights can dazzle drivers behind and make your brake lights difficult to notice.

25. D - They'll dazzle other drivers

Rear fog lights shine more brightly than normal rear lights, so that they show up in reduced visibility. When the visibility improves, you must switch them off; this stops them dazzling the driver behind.

26. C - To help prevent skidding in deep snow

Chains can be fitted to your wheels in snowy conditions. They can help you to move off without wheelspin, or to keep moving in deep snow. You'll still need to adjust your driving to suit these conditions.

27. B - By changing to a lower gear

You should brake and slow down before selecting a lower gear. The gear can then be used to keep the speed low and help you control the vehicle. This is particularly helpful on long downhill stretches, where brake fade can occur if the brakes overheat.

28. D - You'll have less steering and braking control

Letting your vehicle roll or coast in neutral reduces your control over steering and braking. This can be dangerous on downhill slopes, where your vehicle could pick up speed very quickly.

29. B - Ten times the normal distance

Don't travel in icy or snowy weather unless your journey is essential. Drive extremely carefully when roads are or may be icy. Stopping distances can be ten times greater than on dry roads.

30. C - Use your headlights

If you’re driving on a motorway at night or in poor visibility, you must always use your headlights, even if the road is well lit. Other road users must be able to see you, but you should avoid causing dazzle.

31. B - Dipped headlights

If you’re driving behind other traffic on the motorway at night, use dipped headlights. Main-beam headlights will dazzle the other drivers. Your headlights’ dipped beam should fall short of the vehicle in front.

32. C - The condition of the tyres

Having tyres correctly inflated and in good condition will ensure they have maximum grip on the road; how well your tyres grip the road has a significant effect on your car's stopping distance.

33. B - When you change to a lower gear

You will feel the effect of engine braking when you take your foot off the accelerator. Changing to a lower gear will increase the effect.

34. A - Dipped headlights

Only use your fog lights when visibility is seriously reduced. Use dipped headlights in poor conditions because this helps other road users to see you without the risk of causing dazzle.

35. C - To make them more visible in thick fog

Rear fog lights make it easier to spot a vehicle ahead in foggy conditions. Avoid the temptation to use other vehicles' lights as a guide, as they may give you a false sense of security.

36. D - Whether your journey is essential

Consider whether the increased risk is worth it. If the weather conditions are bad and your journey isn’t essential, then don't drive. If you have to drive, make sure you're well prepared in case you get stuck.

37. C - The windows and lights are clean and clear

If you have to drive in fog, switch your dipped headlights on and keep all your windows clear. You should always be able to pull up within the distance you can see ahead.

38. A - Switch off your fog lights

You must turn off your fog lights if visibility is more than 100 metres (328 feet). Be prepared for the fact that the fog may be patchy and you may need to turn them on again if the fog returns.

39. A - They may be confused with brake lights

If your rear fog lights are left on when it isn’t foggy, the glare they cause makes it difficult for road users behind to know whether you’re braking or you’ve just forgotten to turn off your rear fog lights. This can be a particular problem on wet roads and on motorways. If you leave your rear fog lights on at night, road users behind you are likely to be dazzled and this could put them at risk.

40. C - It will reduce your control

Holding the clutch down or staying in neutral for too long will cause your vehicle to freewheel. This is known as 'coasting' and it's dangerous because it reduces your control of the vehicle.

41. D - The vehicle will gain speed more quickly

Coasting is when you allow the vehicle to freewheel in neutral or with the clutch pedal depressed. When travelling downhill, this will cause the vehicle to gain speed more quickly as you lose the benefits of engine braking; it may even lead to a loss of control. You shouldn't coast, especially when approaching hazards such as junctions or bends and when travelling downhill.

42. B - Use a low gear and drive slowly

In normal conditions, a ford can be crossed quite safely by driving through it slowly. The water may affect your brakes, so when you're clear of the ford, test them before you resume normal driving.

43. A - There won't be any engine braking

Try to look and plan well ahead. Plan your approach to hazards and select the correct gear in good time. This will help give you the control you need to deal with anything unexpected that may occur.

44. C - When you're driving in poor visibility

You must use dipped headlights when daytime visibility is seriously reduced, generally to 100 metres (328 feet) or less. You may also use front or rear fog lights, but they must be switched off when visibility improves.

45. D - Stay at a reduced speed for the whole stretch of road

Traffic-calming measures are designed to protect vulnerable road users. Keep your speed down where traffic-calming measures are in place.
